

Murray Basin Resources is a exploration & resource development company.

MBR has been awarded priority for two tenements in Victoria. It is hoped they will be granted late 2014.

The initial phase of the exploration program will involve a desk-top study of the area and site visits to enable the management team to familiarise themselves with the area and to further establish relationships with key stakeholders within the industry.

The desk-top study will include research into the details contained within any historical records pertaining to any Exploration License's previously held over the area. This will include an analysis of the

- Know resources
- Inferred resources
- Geological formations
- Drill hole logs and associated data
- Geological surveys completed to date, and ideally also
- Identify geological formations
- Map key areas

Initial information available to MB Resources suggests that the desk-top study will primarily focus on the granite plutons which we believe provided the heat source for potential mineralisation. Our particular focus will be the associated fault and lineaments.

Following the completion of the desk-top study, further site visits and initial surface surveys will be completed to further assist in identifying areas with the highest resource potential. Should the results of the desk-top study and surface surveys indicate key areas for further exploration; a drilling program will be developed to provide strategic information on any in-situ resource. Prior to the formulation and undertaking of any drilling program, full consultation will be conducted with the land owners and associated stakeholders in the area.
